1. Refactor the code:
   1) Instead of using index to get the column every time I need them, I created a SongInfo class and store all the information as fields.
   2) Make several minor modifications to improve accuracy.
   3) Modified the code so that it runs faster (previous 5min and now 3min)
   4) Change every query into functions, improve readability
   5) Use higher order function in the top5* query to avoid code duplication.
2. Refine the report:
   1) Display both id and name when showing the results.
   2) Make them as tables so that it's more compact and readable.
   3) Add assumptions
   4) Add more conclusions
